SRC PACKAGE

1.1 Subpackages

1.1.1 gui package

button_area module

button_area.py

Author: Dongzi Ding Created: 2023-06-25 Modified: 2023-08-14

class src.gui.button_area.**ButtonArea**(parent=None)

Bases: QWidget

Main button area of the application which provides the necessary buttons for the user to interact with the application.

Attributes:

- result: A dictionary storing the results.
- figures: A dictionary storing the generated figures.
- main_window: Reference to the main application window.

calculate()

Calculate functionality of the application.

reset()

Reset functionality of the application.

save_result()

Save result functionality of the application.

show_result()

Show result functionality of the application.

show_visual()

Show visual functionality of the application.

update_start_button()

class src.gui.button_area.**OptionDialog**(selected_features, parent=None)

Bases: QDialog

A dialog for selecting analysis options.

get_options(feature)

`use_both()`

`use_sklearn()`

input_window module

input_window.py

Author: Dongzi Ding Created: 2023-06-27 Modified: 2023-08-14

class `src.gui.input_window.InputWindow`(*parent=None*)

Bases: `QWidget`

A `QWidget` class that represents the input window for user data.

Attributes:

- `input_changed` (`pyqtSignal`): Signal emitted when the input changes.

browse_file()

Handles the file browsing and data extraction for the selected features.

clear_data()

Clears the stored data.

emit_input_changed()

Emits the `input_changed` signal.

input_changed

manual_input()

Handles the manual input of data by the user.

reset()

Resets the input window to its default state.

update_content()

Updates the input method based on the user's selected option.

result_window module

result_window.py

Author: Dongzi Ding Created: 2023-06-28 Modified: 2023-08-14

class `src.gui.result_window.ResultWindow`(*parent=None*)

Bases: `QMainWindow`

A `QMainWindow` class that represents the result window for displaying analysis results.

Attributes:

- `tab_widget` (`QTabWidget`): Widget to manage multiple result tabs.

add_result(*title, result, feature_name*)

Adds a result to a new tab based on the `feature_name`.

Args:

- `title` (`str`): The title for the new tab.
- `result` (`dict` or `tuple`): The result data.
- `feature_name` (`str`): The name of the analysis feature.

settings_window module

settings_window.py

Author: Dongzi Ding Created: 2023-06-26 Modified: 2023-08-14

class src.gui.settings_window.**SettingsWindow**(parent=None)

Bases: QWidget

A window displaying user settings and associated instructions.

Attributes:

- main_window (QWidget): Reference to the main application window.
- guide_textedit (QTextEdit): Text area displaying guidance for selected settings.
- scroll_area (QScrollArea): Scroll area housing the guide text.
- option_label (QLabel): Label showing current selected options.

update_content()

Update the content displayed based on the user's selected settings.

visual_window module

visual_window.py

Author: Dongzi Ding Created: 2023-07-01 Modified: 2023-08-14

class src.gui.visual_window.**VisualWindow**(pixmap, parent=None)

Bases: QMainWindow

A QMainWindow class to display an image in a window for visualization purposes.

Attributes:

- image_label (QLabel): A label widget to display the image.
- central_widget (QWidget): The central widget containing the image label.

1.1.2 utils package

initial_rate module

initial_rate.py

Author: Dongzi Ding Created: 2023-06-25 Modified: 2023-08-14

src.utils.initial_rate.**calculate_rate**(time, conc, threshold)

Calculates the rate of a reaction using linear regression on a subset of data.

Parameters:

- time (array): Time data.
- conc (array): Concentration data.
- threshold (float): Percentage of data to use for regression.

Returns:

Dictionary containing time, concentration, slope, intercept, and R squared values.

`src.utils.initial_rate.calculate_rate_compare(time, conc)`

Calculates rates using different thresholds and compares the fits.

Parameters:

- `time` (array): Time data.
- `conc` (array): Concentration data.

Returns:

Dictionary containing time, concentration, slopes, intercepts, and R squared values for each threshold.

`src.utils.initial_rate.cut_data(time, conc, threshold)`

Filters time and concentration data based on a threshold.

Parameters:

- `time` (array): Time data.
- `conc` (array): Concentration data.
- `threshold` (float): Threshold value for filtering.

Returns:

Filtered arrays of time and concentration values.

`src.utils.initial_rate.plot_initial_rate(time, conc, slope, intercept, r_squared)`

Generates a plot of the initial reaction rate.

Parameters:

- `time` (array): Time data.
- `conc` (array): Concentration data.
- `slope` (float): Slope from linear regression.
- `intercept` (float): Intercept from linear regression.
- `r_squared` (float): R squared value from linear regression.

Returns:

A QPixmap object containing the plot.

`src.utils.initial_rate.plot_rate_comparison(time, conc, slopes, intercepts, r_squared_values)`

Generates a plot comparing reaction rates for different thresholds.

Parameters:

- `time` (array): Time data.
- `conc` (array): Concentration data.
- `slopes` (list): List of slopes from linear regressions.
- `intercepts` (list): List of intercepts from linear regressions.
- `r_squared_values` (list): List of R squared values from linear regressions.

Returns:

A QPixmap object containing the comparison plot.

`src.utils.initial_rate.read_data(filename)`

Reads experimental data from an Excel file.

Parameters:

- `filename` (str): Path to the Excel file.

Returns:

Arrays of time and concentration values.

input_help module

input_help.py

Author: Dongzi Ding Created: 2023-07-28 Modified: 2023-08-14

class src.utils.input_help.DataInputDialog(*parent=None*)

Bases: QDialog

A custom dialog for the user to input experimental data.

Attributes:

- `main_window` (QWidget): Reference to the main application window.
- `input_data` (dict): Dictionary storing input data after confirmation.
- `data_types` (dict): Dictionary defining the expected data types for each tab.
- `tab_widget` (QTabWidget): Widget containing tabs for each analysis type.
- `list_widgets` (dict): Dictionary storing list widgets for each tab.
- `input_fields` (dict): Dictionary storing input fields for each data type and tab.
- `check_boxes` (dict): Dictionary storing checkboxes indicating readiness for each data type and tab.

confirm_input()

Validates and confirms the input data from the current tab.

get_input_data()

Converts input strings to numeric data and returns a dictionary.

select_all(*state*)

Selects all items in the current tab's QListWidget.

update_input_fields(*item*)

Enables or disables the input field and checkbox for a clicked item.

plane3D_plot module

plane3D_plot.py

Author: Dongzi Ding Created: 2023-08-12 Modified: 2023-08-17

This file contains functions for performing 3D plotting and regression analysis on data. It includes functions for reading data, plotting 3D scatter points, and fitting a plane to the data.

class src.utils.plane3D_plot.Plane3DPlotter(*filename=None*)

Bases: object

Attributes:

- `filename` (str): Name of the input Excel file containing data.
- `data` (tuple): Processed data from the Excel file.
- `log_initial_concentration` (array): Logged values of initial concentrations.
- `log_initial_rate` (array): Logged values of initial rates.
- `pH` (array): pH values from the data.
- `params` (tuple): Parameters of the fitted plane.
- `r_squared` (float): R-squared value of the fitted model.

create_3D_plot(*ax=None*)

Creates a 3D plot with data points.

Args:

- *ax* (Axes3D, optional): Existing 3D axes if provided. Defaults to None.

Returns:

fig, ax: Figure and axes objects of the plot.

fig_to_pixmap(*fig*)

Converts a matplotlib figure to a QPixmap.

Args:

- *fig* (Figure): Matplotlib figure to be converted.

Returns:

QPixmap: Converted QPixmap of the figure.

fit_plane(*log_initial_concentration, pH, log_initial_rate*)

Fits a plane to the given 3D data.

Args:

- *log_initial_concentration* (array): Logged values of initial concentrations.
- *pH* (array): pH values.
- *log_initial_rate* (array): Logged values of initial rates.

Returns:

tuple: Parameters of the fitted plane and R-squared value.

get_results()

Returns the parameters of the fitted plane and R-squared value.

Returns:

dict: Parameters of the fitted plane and R-squared value.

perform_analysis()

Performs 3D analysis on the data.

Returns:

tuple: Parameters of the fitted plane and R-squared value.

plot_3D_data(*ax=None*)

Plots the 3D data and fitted plane.

Args:

- *ax* (Axes3D, optional): Existing 3D axes if provided. Defaults to None.

Returns:

fig, ax: Figure and axes objects of the plot.

plot_fitted_plane(*ax, params*)

Plots the fitted plane on the given 3D axes.

Args:

- *ax* (Axes3D): 3D axes object to plot on.
- *params* (tuple): Parameters of the fitted plane.

read_data(*filename*)

Reads data from the specified Excel file and returns logged values.

Args:

- filename (str): Name of the Excel file to read from.

Returns:

tuple: Logged initial concentration, logged initial rate, and pH values.

rate_const module**rate_const.py**

Author: Dongzi Ding Created: 2023-08-10 Modified: 2023-08-14

`src.utils.rate_const.calculate_rate(time, conc)`

Calculates the reaction rate using regression on logarithmic concentration.

Args:

- time (array-like): Array of time values.
- conc (array-like): Array of concentration values.

Returns:

Calculated values including time, logarithmic concentration, slope, intercept, and R squared value.

`src.utils.rate_const.plot(time, conc, slope, intercept, r_squared)`

Plots the given time and logarithmic concentration data with a linear fit.

Args:

- time (array-like): Array of time values.
- conc (array-like): Array of logarithmic concentration values.
- slope (float): Slope from linear regression.
- intercept (float): Intercept from linear regression.
- r_squared (float): R squared value from linear regression.

Returns:

PyQt5.QtGui.QPixmap: QPixmap representation of the plot.

`src.utils.rate_const.read_data(filename)`

Reads data from the given filename.

Args:

- filename (str): Path to the data file.

Returns:

Time and concentration values or None if an error occurs.

regression_analysis module**regression_analysis.py**

Author: Dongzi Ding Created: 2023-06-28 Modified: 2023-08-17

`src.utils.regression_analysis.calculate_log_values(initial_concentration, initial_rate)`

Calculates the log values of the initial concentration and rate.

Args:

- initial_concentration (array-like): Initial concentrations.
- initial_rate (array-like): Initial rates.

Returns:

Log values of the initial concentration and rate.

`src.utils.regression_analysis.calculate_regression(log_concentration, log_rate)`

Calculates the linear regression of the log values using sklearn.

Args:

- `log_concentration` (array-like): The log concentration data.
- `log_rate` (array-like): The log rate data.

Returns:

Slope (reaction order), intercept, and the R-squared value.

`src.utils.regression_analysis.plot_regression(log_concentration, log_rate, slope, intercept, r_squared, label, color, ax, fig)`

Plots the data and the regression line.

Args:

- `log_concentration` (array-like): The log concentration data.
- `log_rate` (array-like): The log rate data.
- `slope` (float): Slope of the regression line.
- `intercept` (float): Intercept of the regression line.
- `r_squared` (float): R-squared value.
- `label` (str): Label for the plot.
- `color` (str): Color for the plot.
- `ax` (matplotlib.axes.Axes): Axes object to draw the plot onto.
- `fig` (matplotlib.figure.Figure): Figure object containing the Axes.

Returns:

PyQt5.QtGui.QPixmap: QPixmap representation of the plot.

`src.utils.regression_analysis.read_data(filename)`

Reads data from an Excel file.

Args:

- `filename` (str): Path to the Excel file.

Returns:

Data extracted from the file or None if an error occurs.

save module

save.py

Author: Dongzi Ding Created: 2023-06-25 Modified: 2023-08-14

`src.utils.save.save(result, dirname, figures)`

Saves the result data to CSV files and figures to PNG files.

Parameters:

- `result` (dict): Dictionary containing the analysis results.
- `dirname` (str): Directory path where the results will be saved.
- `figures` (dict): Dictionary containing figures for saving as PNG.

Returns:

None

1.2 mainwindow module

1.2.1 mainwindow.py

Author: Dongzi Ding Created: 2023-06-25 Modified: 2023-08-14

Main window for the application. This module provides the main application window for the PyQt5-based GUI application. It includes menu bars for feature selections, input settings, save settings, help, and developer contact.

class src.mainwindow.MainWindow(*parent=None*)

Bases: QMainWindow

The main window for the PyQt5-based GUI application.

check_calculate_button_state()

Checks if the 'Calculate' button should be enabled.

open_contact()

Opens the appropriate contact method based on the menu selection.

select_option1()**select_option2()****select_option3()****select_option4()****select_option5()****select_option6()****select_option7()****select_option8()****toggle_option(*checked, option*)**

Toggles the current function option.

update_func_option(*checked*)

Updates the current function option based on the menu selection.

class src.mainwindow.Settings

Bases: QObject

Represents application settings.

Attributes:

- **func_current_options** (dict): Current functional options selected.

reset()

Resets the settings to default values.

set_func_option(*option*)

Sets the current function option.

set_input_option(*option*)

Sets the current input option.

set_save_option(*option*)

Sets the current save option.

settings_changed

`src.mainwindow.resource_path`(*relative_path*)

Gets the absolute path to a resource, works in both development and PyInstaller contexts.

Args:

- *relative_path* (str): The relative path to the resource.

Returns:

The absolute path to the resource.

INDICES AND TABLES

- `genindex`
- `modindex`
- `search`
